Introduction to clinical medecine

This cycle of seminars is provided by hospital specialists in ophtalmology, orthopaedics and pulmonology, and by a biomedical engineer working in the design of biomedical devices. Through specific examples, this course demonstrates the close links that clinicians and engineers must develop to effectively solve the problems posed by complex pathologies that are difficult to understand without considering them as a whole. Each seminar includes an introductory part to acquire anatomical, physiological and clinical knowledge of the specialities presented.
